

# Title: Margin Expansion Through Cost Reduction Focused Redesign Of A Bicycle

Course Title: Project Management CRN 61238 Course Number: ETM 545 Instructor: Dr. Richard Sperry Term: Spring Term Year: 2015 Author(s): Erica Merckling and Mufeed Yacoub

Report No.:	
Туре:	Student Project
Note:	

ETM OFFICE USE ONLY

# **Charter/Overview**

The aim of this project is to redesign elements of one of our company's legacy products, a standard five speed commuter bicycle, in an effort to cut costs and expand the product's profit margin through cost reduction. Through mechanical engineering, manufacturing engineering, component engineering, marketing, and engineering change researcher efforts, areas for cost improvements will be identified and developed through redesign. The tasks associated with these functional areas are clearly outlined in Appendix A and the resources responsible for these tasks are clearly outlined in Appendix B with resource loading addressed in Appendix J.

Ultimately, mechanical components will be redesigned, manufacturing processes optimized, and labor and overhead will be analyzed in order to address current design and production problems and identify areas of high cost that can be improved. In turn, these improvements will be realized through product implementation.

# **Project Scope**

The three main objectives of this project are as follows:

- Cross-functionally identify areas of high cost
- Collaboratively brainstorm and identify actions to drive cost out of the product in order to expand profit margin with the goal of reducing the overall cost of the product by 10% which equates to an additional 10% increase in margin
- Work cross-functionally as a project team to implement identified cost reduction changes in order to release these changes into production

This project will not address the following and all endeavors related to these items will be considered out of the scope of this project:

- Adding new features or value to the product; this is strictly a cost reduction exercise
- Using the margin expansion realized in this project to reduce the overall average sales price of the product; this is out of the scope of the project and ultimately up to upper management to assess further down the road
- Implementing cost reduction measures across all product lines; the project manager will include recommendations for future projects as part of the termination phase of this project, as described in the termination task list in Appendix O, but the project manager will not guarantee that all cost reduction measures identified and implemented in this project will automatically translate and apply to cost reduction in other product lines

# **General Approach**

This project will be led by a Project Manager who will coordinate the project to completion with contribution from five departments within the organization including; Mechanical Engineering,

Manufacturing Engineering, Component Engineering, Marketing, and Engineering Change Orders as shown in organizational chart in Appendix C . As illustrated in the RACI Matrix in Appendix B, to achieve optimal cost reduction in the process and in the design of the bicycle, each department involved will be accountable for the tasks specifically pertaining to their department with the input of closely affected departments.

To complete this project on schedule, as indicated in baseline schedule in Appendix D, a resource loading table was composed, as shown in Appendix J, which identifies hours to be spent by each resource/department on each task. And if delays or deviations occur to the schedule or resource availability the project manager will easily take notice and act accordingly using the critical rate control limits in Appendix M.

It is our objective to be aligned with our goal as company to be in pursuit of harmonious growth and enhancement of profitability. This proposed project will give us the opportunity to re-evaluate the numerous aspects involved in producing our standard five speed commuter bicycle. As this bicycle is our top seller (our bread and butter), we are intestinally focusing on its re-evaluation since it would be the most financially impactful once the margin is expanded.

It is our aim to cut costs and expand the product's profit margin, not necessarily to reduce the cost of the product, but its upper management's purgative how to best utilize the savings identified.

As our company produces and sells their products in house, there will be no contractual obligation with third parties other than direct part suppliers.

# Schedules

The project will begin on January 1<sup>st</sup> and is scheduled to be completed on May 19<sup>th</sup> as detailed in the summary/ aggregate baseline schedule in Appendix D. There will be five phase gates, as shown below, to internally track the progress of the project:

- BOM Scrub
- Market Research
- Manufacturing Analysis
- ECO Process
- Mechanical Engineering Redesign

Like most projects, the schedule of this project is bound to change and vary throughout the length of the project. In an effort to mitigate this risk, optimistic, most likely, and pessimistic task duration estimates are outlined and provided in the probability table in Appendix F. A

probability distribution of project completion times in Appendix I visually represents the probability of completing the project between 110 and 148 days. Budget and cost are also bound to change along with the schedule. Through careful analysis a bottom up budget has been outlined in Appendix E in an effort to accurately estimate project costs and a project schedule has been outlined with the critical path clearly identified and outlined in red in Appendix G. Associated task slack times are outlined in the activity on node network and associated table in Appendix H.

#### **Resources/Personnel**

The following functional resources, and their associated responsibilities, will be required to successfully complete the project:

- Component Engineer (C.E.): Responsible for the analysis and scrub of the bill of materials (BOM), sourcing all BOM items, identifying areas for margin improvement relative but not limited to component engineering, and engaging in cross-functional communication with members of the project team
- Market Researcher: Responsible for market analysis, identifying the business
  opportunity for cost reducing the product, seeking the voice of customer (VOC),
  providing VOC analysis, constructing the quality function deployment (QFD) diagram,
  and engaging in cross-functional communication with members of the project team
- Manufacturing Engineer (Mfg.E.): Responsible for identifying areas for margin improvement relative but not limited to manufacturing (including but not limited to process, labor, overhead, supplier, waste, and shipping) and engaging in cross-functional communication with members of the project team
- Mechanical Engineer (M.E.): Responsible for identifying areas of margin improvement relative but not limited to the mechanical aspects of the product, mechanical redesign and associated analysis, verification, validation and safety testing as well as engaging in cross-functional communication with members of the project team
- Engineering Change Order Researcher: Responsible for writing the engineering change order (ECO) and request (ECR), implementing changes relative to the engineering change order, and engaging in cross-functional communication with members of the project team
- Project Manager (PM): Responsible for facilitating cross-functional communication within the team and to departments outside of the project, holding team members accountable for their deliverables (either directly or indirectly through the team member's functional manager) and ultimately responsible for all project tasks

Please note that each resource may delegate tasks to other personnel or split tasks between personnel in their functional department which is demonstrated in the responsible, accountable, consult, inform (RACI) matrix of Appendix B.

#### **Risk Management**

There are several areas of risk that will need to be controlled and potentially mitigated. Scope, budget/cost, and schedule are the obvious areas of critical importance which will be monitored through the critical ratio equation and associated chart throughout the course of the project, as shown in Appendix N. Additional areas to formally monitor and control are expressed in Appendix M and shown below:

- Estimated Percent of Cost Reduction
- Technical Feasibility
- Return on Investment/Payback Period
- Team Member Morale and Participation

Other factors will be monitored by the project manager on a more informal basis such as market potential and acceptance, competitor movement, and manufacturing hiccups. However, as the project progresses, the project manager will need to be open to monitoring and controlling additional areas of risk as they become known in order to effectively execute the project.

# **Project Monitoring and Control**

The overall performance of the project will be measured on a bi-monthly basis by the Project Manager using an aggregate performance measurement. Using the Planned Value table in Appendix K, assuming the 50-50 rule for all activities and using the simple graph illustrating the earned value as shown in Appendix L, the Project Manager will be able to identify if the total value of the work accomplished is in balance with the planned cost.

The critical ratio will also be utilized by the PM on a bi-weekly basis as illustrated in the critical ratio chart in Appendix N, to determine the status of the actual progress and cost compared to the scheduled progress and cost. Additionally, there are several areas of the project which will be monitored as listed in Appendix M in order to predict the project's outcome and insure the desired progress.

# **Project Termination and Evaluation**

This project will be terminated on 05/19/2016 through termination by integration following the engineering release of the newly cost reduced project. A high level of the termination task list shown in Appendix O is as follows:

Termination by Integration Task List

- 1. Personnel
  - 1.1. Component Engineering Responsibilities
    - 1.1.1. Resume role and normal job functions
    - 1.1.2. Resume reporting to functional manager
    - 1.1.3. Determine sustaining support role
  - 1.2. Marketing Responsibilities
    - 1.2.1. Resume role and normal job functions
    - 1.2.2. Resume reporting to functional manager
    - 1.2.3. Determine sustaining support role
  - 1.3. Manufacturing Responsibilities
  - 1.4. ECO Researcher Responsibilities
  - 1.5. Mechanical Engineering Responsibilities
- 2. Mechanical Engineering
- 3. Manufacturing
- 4. Marketing
- 5. Equipment, Purchasing, Distribution, etc.
- 6. Risk Identification and Management
- 7. Project History and Project Audit Report

# Appendices

# Appendix A

Action Plan								
Objective: Cost Reduction								
Steps	Responsibility							
1. Component Engineering BOM Scrub								
1.1 Pull current BOM	Component Engineer							
1.2 Source all items and materials	Component Engineer							
1.3 ID areas for margin improvement	Component Engineer							
1.4 Communicate findings cross-functionally to manufacturing and engineering for evaluation	Component Engineer							
1.5 Evaluate manufacturing and engineering feedback/concerns	Component Engineer							
2. Marketing Research								
2.1 VOC								
2.1.1 ID Business Opportunity	Market Researcher							
2.1.2 ID concerns, complaints, must haves, wouldn't it be cool if's	Market Researcher							
2.2 QFD								
2.2.1 ID Customer Needs	Market Researcher							
2.2.2 ID Key Features	Market Researcher							
2.2.3 ID high cost materials	Market Researcher							
2.2.4 Determine features that can be altered for cost reduction	Market Researcher							
3. Manufacturing Concerns								
3.1 Process Improvement (reducing constraints/bottle necking)	Manufacturing Engineer							
3.2 Labor Improvement	Manufacturing Engineer							
3.3 Overhead Improvement	Manufacturing Engineer							
3.4 Re-evaluate Part Suppliers	Manufacturing Engineer							
3.5 Waste Reduction (Lean Manufacturing)	Manufacturing Engineer							
3.6 Shipping Material Cost Reduction	Manufacturing Engineer							
3.7 Join all analysis to identify conflicts and finalize	Manufacturing Engineer							
4. ECO Process								
4.1 Write engineering change request								
4.1.1 ID what needs to be changed	ECO Researcher							
4.1.2 ID reason for change	ECO Researcher							
4.1.3 Write description of change	ECO Researcher							
4.1.4 List documents and departments affected by change	ECO Researcher							
4.2 Get project into queue	ECO Researcher							
4.3 Work cross-functionally with sustaining for approval	ECO Researcher							
4.4 Implement changes	ECO Researcher							
5. Engineering Redesign Product								

5.1 Mechanical redesign	Mechanical Engineer			
5.2 Safety compliance verified	Mechanical Engineer			
5.3 FEA analysis	Mechanical Engineer			
5.4 Order prototypes and tooling	Mechanical Engineer			
5.5 Evaluate prototypes	Mechanical Engineer			
5.6 Order production parts	Mechanical Engineer			
5.7 Final Field Validation	Mechanical Engineer			
5.8 Final Verification	Mechanical Engineer			
5.9 Final Safety Testing	Mechanical Engineer			
5.10 Release cost reduced product	Mechanical Engineer

# Appendix C

In relation to the rest of the organization this project is a balanced matrix where the project and functional managers have balanced control over the project and resources. Both managers are expected to work together and maintain mutual respect for each other throughout the length of the project. Below is a figure demonstrating this positioning. Our project is highlighted in yellow.

Positioning of Our Project Relative to the Organization

#### Appendix D

The table below outlines the summary/aggregate baseline schedule of the project. It is important to note that the main schedule driver is the fact that bicycle sales spike during the warmer summer months of June, July and August. So there is definitely a sense of urgency for completing this project on time.

		Summary/Aggre	gate Base	line Sc	hedule	9

#### **Appendix H AON Network Diagram**

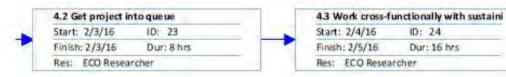

The Activity on Network Diagram below is a Microsoft Project populated visual representation of the schedule's critical path and associated resources as shown in the Gantt chart of Appendix G. Please note that the critical path is again highlighted in red. Also, the associated table that follows demonstrates the slack times associated with each task.

	5.2 Safety compliance verified	48					24h	24h									
	5.3 FEA analysis	32						24h	8h								
	5.4 Order prototypes and tooling	120							56h	48h	16h						
	5.5 Evaluate prototypes	80									56h	24h					
	5.6 Order production parts	120										24h	56h	40h			
	5.7 Final Field Validation	16												16h			
	5.8 Final Verification	16												8h	8h		
	5.9 Final Safety Testing	16													16h		
	5.10 Release cost reduced product	24														24h	

# Appendix K

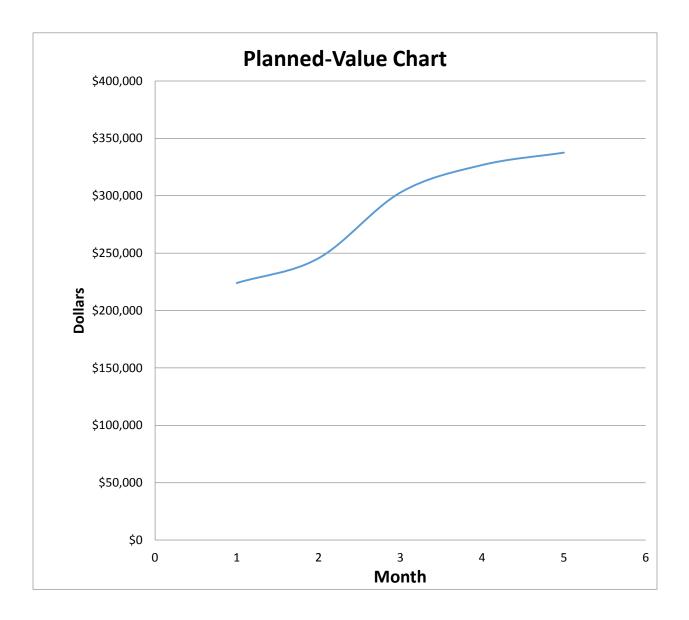

The baseline budget (PV) using the 50–50 rule is calculated in the table below. Fifty percent completion is assumed when the task is begun, and the remaining 50 percent when the work is complete.

Planned-Value with 50-50 as	sumption	for all tas	ks			
Task	Estimate	Jan	Feb	Mar	Apr	May
1. Component Engineering BOM Scrub						
1.1 Pull current BOM	\$800	\$800				
1.2 Source all items and materials	\$3,200	\$3,200				
1.3 ID areas for margin improvement	\$8,000	\$8,000				
1.4 Communicate findings cross-functionally to manufacturing and engineering for evaluation	\$1,600	\$1,600				
1.5 Evaluate manufacturing and engineering feedback/concerns	\$4,000	\$3,200	\$800			
2. Marketing Research						
2.1 VOC						
2.1.1 ID Business Opportunity	\$2,400	\$2,400				
2.1.2 ID concerns, complaints, must haves, wouldn't it be cool if's	\$2,400	\$2,400				
2.2 QFD						
2.2.1 ID Customer Needs	\$1,600	\$1,600				
2.2.2 ID Key Features	\$1,600	\$1,600				
2.2.3 ID high cost materials	\$1,600	\$1,600				
2.2.4 Determine features that can be altered for cost reduction	\$3,200	\$3,200				
3. Manufacturing Concerns						
3.1 Process Improvement analysis (reducing constraints/bottle necking)	\$4,000	\$4,000				
3.2 Labor Improvement analysis	\$2,400	\$2,400				
3.3 Overhead Improvement analysis	\$3,200	\$3,200				
3.4 Re-evaluate Part Suppliers	\$6,400	\$6,400				
3.5 Waste Reduction analysis (Lean Manufacturing)	\$4,000	\$4,000				
3.6 Shipping Material Cost Reduction analysis	\$2,400	\$2,400				
3.7 Join all analysis to identify conflicts and finalize	\$3,200	\$3,200				
4 ECO Process						
4.1 Write engineering change request						

Cumulative Total	\$168,800	\$224,000	\$245,600	\$302,800	\$326,800	\$337,600
Total	\$168,800	\$55,200	\$21,600	\$57,200	\$24,000	\$10,800
5.10 Release cost reduced product	\$2,400					\$2,400
5.9 Final Safety Testing	\$1,600					\$1,600
5.8 Final Verification	\$1,600				\$800	\$800
5.7 Final Field Validation	\$1,600				\$1,600	
5.6 Order production parts	\$20,000				\$20,000	
5.5 Evaluate prototypes	\$8,000			\$6,400	\$1,600	
5.4 Order prototypes and tooling	\$50,000			\$50,000		
5.3 FEA analysis	\$3,200		\$2,400	\$800		
5.2 Safety compliance verified	\$4,800		\$4,800			
5.1 Mechanical redesign	\$8,000		\$8,000			
5. Engineering Redesign Product						
4.4 Implement changes	\$6,000					\$6 <i>,</i> 000
4.3 Work cross-functionally with sustaining for approval	\$1,600		\$1,600			
4.2 Get project into queue	\$800		\$800			
4.1.4 List documents and departments affected by change	\$800		\$800			
4.1.3 Write description of change	\$800		\$800			
4.1.2 ID reason for change	\$800		\$800			
4.1.1 ID what needs to be changed	\$800		\$800			

# Appendix L

A baseline planned-value chart based on the planned-value table assuming the 50-50 rule for all activities as outlined in Appendix K.

# Appendix M

# **Monitor and Control**

There are several areas of the project that will need to be monitored in order to predict the project's outcome. Once the schedule, budget, and scope are agreed upon by all parties involved those will be the three main areas that must be monitored and controlled in order for the project to be successful. Critical ratio, which is discussed in Appendix N, is a big indicator of how the triple constraint of the project is progressing. Due to the nature of this project the following key factors must also be monitored and controlled:

• Estimated Percent of Cost Reduction/Margin Expansion:

This critical value will fluctuate throughout the project based on tooling costs, supplier negotiations, and the quantity and quality of cost reduction ideas that are identified. However, if at any point during the project the estimated percent of cost reduction of the bicycle becomes negative, meaning cost is being added to the product, the project will need to be reassessed immediately with the possibility of terminating the project early.

• Technical Feasibility:

Generating new ideas, identifying new ways to drive cost out of the product, and implementing associated changes is the ultimate goal of this project. But, these ideas and changes to the product must be technically feasible in order to generate cost savings.

• Return on Investment/Payback Period:

This value is a critical indicator of the project's level of success because ultimately this project will be evaluated based on the percent cost reduction/margin expansion as well as how quickly these savings can be realized. The project will be deemed successful and worth the initial investment if the payback period can be held to one fiscal year.

• Team Member Morale and Participation:

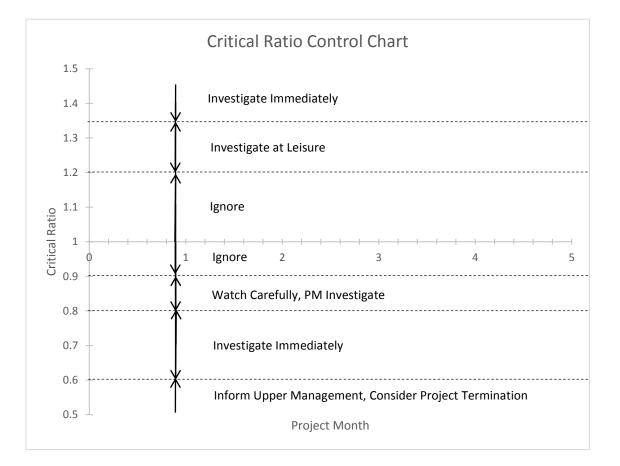

This factor is also critical to gauge, monitor, and influence but, can also be more difficult to decipher. The project manager for this project will need to carefully observe as well as gently influence the team in a positive way that encourages creative thinking which is critical to identifying areas of the product that can be cost reduced, cross-functional collaboration and communication, and on time deliverables. Other factors will be monitored by the project manager on a more informal basis including but not limited to market potential and acceptance, competitor movement, and manufacturing hiccups. Also, as the project progresses additional factors may be added to this list to monitor and control in order to effectively execute the project.

# Appendix N

# Monitor and Control (continued)

Critical ratio will be calculated and plotted on the chart below at each milestone/phase gate throughout the duration of the project in an effort to monitor progress. Critical ratio is equal to actual over scheduled progress multiplied by budgeted over actual cost. In general, a ratio of greater than 1 signifies favorable progress and cost (i.e. meeting or exceeding schedule expectations, meeting or exceeding scope expectations, coming in under budget, or some combination of all three) whereas a ratio of less than 1 signifies unfavorable progress and cost (i.e. not meeting schedule, scope, budget, or some combination of all three).

For the purpose of this project (reduce cost, expand margin, all in a timely fashion so cost savings can be realized as soon as possible), critical ratio is the most complete monitoring tool and project indicator. As opposed to cost variance, cost performance index, schedule variance, and schedule performance index which only indicate either cost or schedule development, critical ratio indicates both.

# Appendix O

The following task list will need to be completed in order for the project to be successfully terminated upon completion of the project tasks. The project will be terminated by integration.

Termination by Integration Task List

- 1. Personnel
  - 1.1. Component Engineering Responsibilities
    - 1.1.1. Resume role and normal job functions
    - 1.1.2. Resume reporting to functional manager
    - 1.1.3. Determine sustaining support role
  - 1.2. Marketing Responsibilities
    - 1.2.1. Resume role and normal job functions
    - 1.2.2. Resume reporting to functional manager
    - 1.2.3. Determine sustaining support role
  - 1.3. Manufacturing Responsibilities
    - 1.3.1. Resume role and normal job functions
    - 1.3.2. Resume reporting to functional manager
    - 1.3.3. Determine sustaining support role
  - 1.4. ECO Researcher Responsibilities
    - 1.4.1. Resume role and normal job functions
    - 1.4.2. Resume reporting to functional manager
    - 1.4.3. Determine sustaining support role
  - 1.5. Mechanical Engineering Responsibilities
    - 1.5.1. Resume role and normal job functions
    - 1.5.2. Resume reporting to functional manager
    - 1.5.3. Determine sustaining support role
- 2. Mechanical Engineering
  - 2.1. Ensure that all engineering change orders have been completed and closed
  - 2.2. Communicate confirmed lead times to all other functional departments
  - 2.3. Monitor final assembly
- 3. Manufacturing
  - 3.1. Ensure technicians and floor staff are aware and trained on all changes (process, assembly order, material, etc.)
  - 3.2. Optimize current production system layout
- 4. Marketing
  - 4.1. Ensure sales department is aware of the changes
  - 4.2. Ensure that the marketing strategy is ready for implementation and optimization
- 5. Equipment, Purchasing, Distribution, etc.
  - 5.1. Ensure all equipment is being fully optimized for maximum production
  - 5.2. Ensure orders have been placed for all materials needed for manufacturing

- 5.3. Communicate distribution plan with each functional department
- 6. Risk Identification and Management
  - 6.1. Identify risks that may prevent successful termination of the project
  - 6.2. Plan for remedial actions should the identified risks occur
- 7. Project History and Project Audit Report
  - 7.1. Compile all phase gate/milestone reviews, implemented changes and their associated documentation and overall benefits, and ultimate cost reduction and margin expansion outcome in one centralized report to effectively communicate the process used throughout the project along with the results of the project
  - 7.2. Include recommendations for future projects of a similar nature; recommendations may include suggesting the cost reduction efforts identified and implemented in this project may be relevant to other product lines and should be referred to for cost reduction focused projects in the future
